

# 2012 DEMOGRAPHIC STATE OF THE STATE REPORT

OKLAHOMA STATE AND COUNTY POPULATION PROJECTIONS THROUGH 2075

---

Steve Barker, MBA  
Sr. Research Analyst/Program Manager  
Policy, Research and Economic Analysis Division  
Oklahoma Department of Commerce

## Executive Summary

Oklahoma's population is projected to top 5 million by the time the state celebrates its 150<sup>th</sup> birthday.

- By the 2020 Census, Oklahoma's population will top 4 million
- By the mid 2050s, Oklahoma's population will top 5 million
- By 2075, Oklahoma's population will top 5.5 million

Oklahoma's population is forecast to grow at an average annual rate of 0.73% over the next 65 years, equivalent to the US Census Bureau's most recent national growth forecasts through 2050. The Census Bureau does not have state level population forecasts.

Counties surrounding present day Tulsa and Oklahoma City metro areas are forecast to see substantial population growth. In 2010, the 14 counties currently included in the Tulsa and Oklahoma City MSAs combined to represent 58.4% of the state's total population but by 2075, those same 14 counties are forecast to represent 64.2% of the state's total population. Tulsa and Oklahoma counties alone will combine to represent 35.6% of the state's population.

<b>2010 Population</b>			
<b>for Counties That Make Up Present Day Tulsa and OKC MSAs</b>

There are 25 counties in Oklahoma forecast to experience population decline over the next 65 years. Many of these counties, mostly in western Oklahoma, experienced their peak population levels in 1910, shortly after Oklahoma achieved statehood. While these counties are expected to continue to experience population declines, the rate of decline is expected to slow over the coming decades.

<b>Counties forecast to experience population decline between 2010 and 2075</b>				
Alfalfa	Cotton	Greer	Jefferson	Roger Mills
Beaver	Craig	Harmon	Kay	Seminole
Blaine	Dewey	Harper	Kiowa	Tillman
Choctaw	Ellis	Hughes	Major	Washita
Cimarron	Grant	Jackson	Nowata	Woods

Oklahoma's population is also expected to live longer on average. An increasingly larger percentage of the state's population will gradually be made up by older population groups.

- In 2010, 13.5% of the state's population was aged 65 or older
- By 2075, 19.8% of the state's population will be aged 65 or older

<b>Statewide population projections by age group</b>				
	<b>2010</b>		<b>2075</b>	
	<b>Population</b>	<b>As %</b>	<b>Projected Population</b>	<b>As %</b>
<b>Age 00 to 04</b>	264,126	7.0%	347,853	6.3%
<b>Age 05 to 09</b>	259,336	6.9%	349,177	6.3%
<b>Age 10 to 14</b>	253,664	6.8%	350,455	6.3%
<b>Age 15 to 19</b>	264,484	7.1%	350,949	6.3%
<b>Age 20 to 24</b>	269,242	7.2%	350,816	6.3%
<b>Age 25 to 29</b>	265,737	7.1%	350,657	6.3%
<b>Age 30 to 34</b>	241,018	6.4%	350,293	6.3%

<b>Total Population</b>	3,751,351	100.0%	5,560,007	100.0%

## Methodology

### *General discussion of projection formulas*

State level projections used in this report start with population counts revealed under the 2010 Decennial Census and follow generally accepted forecasting routines developed by the US Census Bureau. For simplicity, the basic demographic formulas used in this report are as follows:

Population in the current year

+ Births in the current year

- Deaths in the current year

+ Net migration

Equals

Population projection for the next year

Population projection for the next year

+ estimated births in the current year, based on fertility rates and # of women of child bearing age

- Deaths in the current year

+ Net migration

Equals

Population projection for the following year

### *What population groups are included in projections*

All population figures cited in this report, whether historic counts or forward looking projections, include the following:

- All civilian residents living within the state
- Members of the US Armed Forces stationed within Oklahoma
- All persons incarcerated in the state of Oklahoma, including out of state prisoners held at private prisons located within the state

### ***Projection of births and fertility rates***

This report uses statewide total fertility rates from Table S1301 of the US Census Bureau's 2006-2010 American Community Survey. Based on survey responses gathered over 5 years, Table S1301 reports the rate of births per 1,000 women by three age categories. Table S1301 indicates Oklahoma's rate of women with births in the past 12 months (an annual time frame) were:

- Among women aged 15-19 there were 37 births per 1,000 women
- Among women aged 20-34 there were 113 births per 1,000 women
- Among women aged 35-49, there were 15 births per 1,000 women

A summary of Table S1301 is included in Appendix 1.

While birth rates have been generally declining across the United States and in Oklahoma for some time, that rate of decline has also been slowing in recent years. Further, the state's growing Hispanic population typically has a higher birth rate than the rate shown for the population in total.

This report does not project populations by race or ethnicity, but it is assumed that the state's Hispanic population will continue to grow. As the percentage of Hispanics in Oklahoma increases, it is also assumed that the rate of decline in the state's overall birth rate will slow or possibly reverse. Because of the uncertainty surrounding the longer term direction for birth rates in Oklahoma, the population projections in this report assume that the overall birth rate will remain constant over the longer term.

### ***Projection of deaths***

United States survival rates by single age and gender for 2007 were obtained from the US Centers for Disease Control at [http://www.cdc.gov/nchs/data/nvsr/nvsr59/nvsr59\\_09.pdf](http://www.cdc.gov/nchs/data/nvsr/nvsr59/nvsr59_09.pdf) and are included in Appendix 2.

National survival rates were used to calculate Oklahoma life expectancy for each age group over the next 65 years. Those survival rates are not likely to remain static with improvements in health care technology and Oklahoma embarking on efforts like smoking reduction programs and diabetes awareness efforts to change the state's overall health characteristics. However, the rapid onset of other health concerns, like the national epidemic of obesity, could also adversely impact the state's longer term life expectancy figures.

Because of the difficulty in forecasting future changes in life expectancy, Oklahoma's age specific survival rates are assumed to remain constant for the purposes of the populations projections contained within this report.

### ***Projection of net migration***

As difficult as the previous variables are to project, migration is likely even more difficult to gauge. As the state's previous population projections report stated following the release of the 2000 Census results, "The only consistency in Oklahoma's recent migration history has been its unpredictability."

How volatile is this component of population growth? Between 1970 and 1983, Oklahoma's overall population growth rate grew at a heated pace, reaching peak annual growth of 3.6% in 1982. Some less populated counties in eastern Oklahoma, driven in part by new oil discoveries and well construction, experienced double digit annual percentage growth. Then by 1987 the state's annual population growth rate dropped to -1.3% and some of those same double digit growth counties were showing nearly double digit declines. Appendix 3 shows more detailed information about the history of Oklahoma's components of population change, including net migration figures.

Between 1960 and 2011, Oklahoma's population gain due to net migration averaged slightly over 10,000 people annually, with swings ranging from a gain of 80,500 in 1982 to a decline of 61,000 in 1987. Ignoring the volatility found in the 1970s and 1980s, and limiting net migration to the 1990s and 2000s, Oklahoma's average annual net migration gain was just under 15,000. For this analysis, the state's annual population growth figure has been assumed to run at a consistent rate of adding 15,000 people annually.

### ***County population projections***

County population projections were obtained using a more generalized process than the statewide approach already outlined above. Linear regression trendline formulas, based on population patterns from 1960 to 2011, were deemed sufficient to develop county population projections for 64 of Oklahoma's 77 counties. For the remaining 13 counties, straight linear regression formulas yielded unrealistic population levels and another option needed to be used.

Linear models were judged to be insufficient for Alfalfa, Cimarron, Dewey, Ellis, Grant, Greer, Harmon, Harper, Kiowa, Roger Mills, Tillman, Washita and Woods counties. For these counties, a curved, or power, trendline was judged to be a better fit.

Statistically, trendline formulas have a measure of 'fit' known as the r-squared value. The closer the r-squared value is to a value of one, the better the formula matches up with actual population figures. Going one step further, the higher the r-squared value, the better the assumed predictability of future values. This report includes both the trendline formula used for each county's population, plus the associated r-squared value as a measure of how well the formula fits the historic population levels and how well the formula might predict future populations, all other things being held constant.

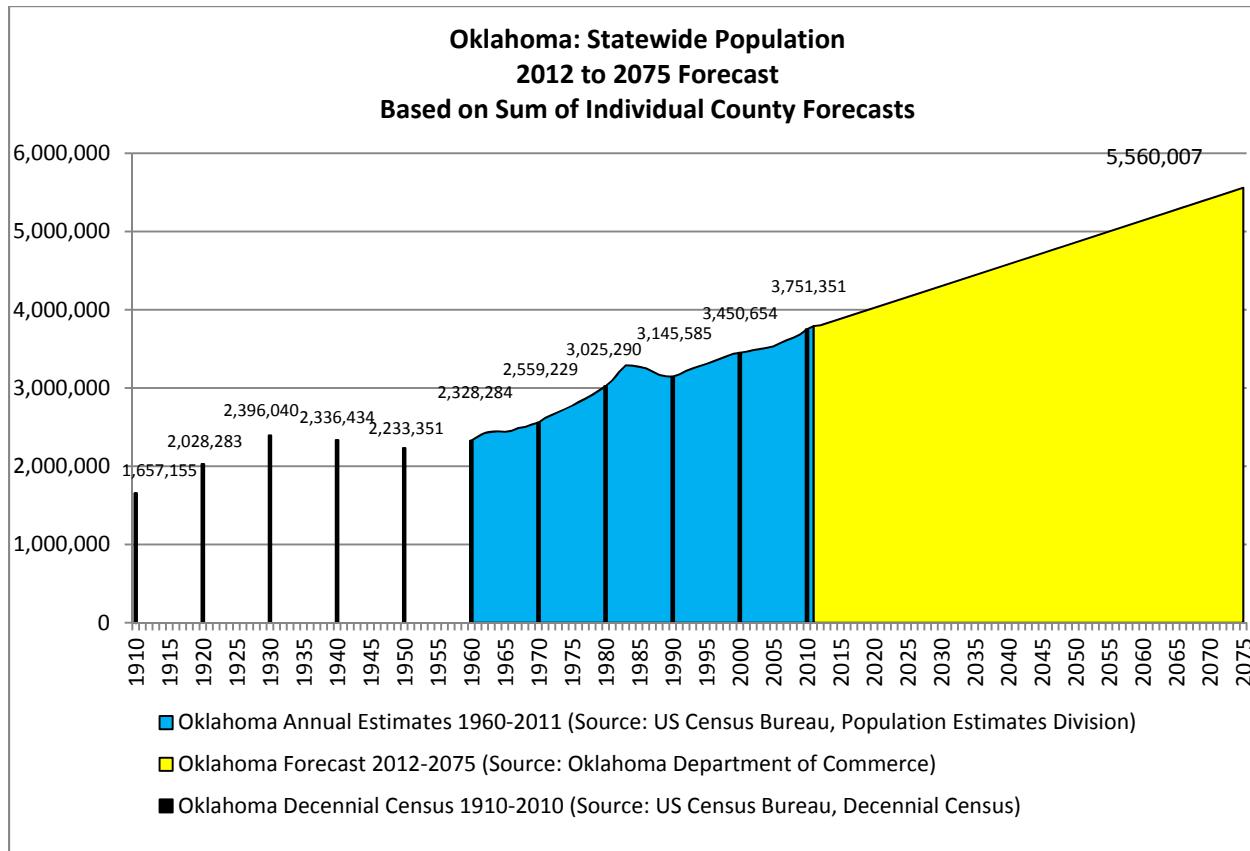

### ***Matching up the two methodologies***

Statewide estimates have been developed using two different methods, each arriving at a similar conclusion before balancing. With each method acting as a comparative “check” against the other, it is believed these estimates are as accurate as possible, excluding any unforeseen changes in economic or political condition.

When the Census Bureau develops annual population estimates based on birth, death and migration data, they encounter situations where the sum of the parts doesn’t exactly equal the expected whole. To resolve the issue, they use a balancing figure that effectively serves as a “margin of error” within their birth, death and migration figures. This report used a similar approach to unify the results of the statewide methodology with the county level methodology.

Summing county level population projections yielded a population total that was comfortably close to the state level population projections, but there was a small degree of difference that necessitated a slight population adjustment at the statewide level. Over the course of the 65 years between 2010 and 2075, the required adjustment averaged 0.2% of each year’s total population. This was deemed an acceptable range of variation and was added into the statewide population total for balancing purposes.

## Oklahoma Statewide

Oklahoma's statewide population projection was built using the sum of population projections for all 77 counties. Annual growth rates are forecast to average 0.73%. This is similar to the state's average annual growth rate of 0.80% over the last three decades, and equivalent to the US Census Bureau's forecast for the national growth rate through 2050.

The following pages contain tables showing Oklahoma's statewide Decennial Census populations going back to statehood; annual population estimates going back to 1960; population projections from 2012 to 2075; and population projections by 5 year age group through 2075 for males, females and the total population.

## Adair County

Adair County's population is forecast to grow at approximately 0.78% on an average annual basis over the next 65 years. This forecast was developed using a linear regression trendline based on the county's population change between 1960 and 2010. The regression formula appears to have a strong degree of fit, with only limited year to year variation from forecasts expected.

## Alfalfa County

Alfalfa County is forecast to experience a slowing rate of population decline over the next 65 years. While a higher rate of decline is expected in the immediate term, later decades are expected to experience lower rates of decline. Over the full 65 year span, the decline is forecast to average an annual rate of -0.37%. A power regression trendline based on the county's population patterns over the last 50 years indicates a strong degree of fit, with only a limited amount of year to year variation expected.

## Atoka County

Atoka County is forecast to experience population growth rates slightly below the state population growth level over the next 65 years. Between 2010 and 2075, Atoka County's expected average annual growth rate is 0.58%. A linear regression trendline based on the county's population patterns over the last 50 years indicates a strong degree of fit, with slight population variation expected from year to year.

## Beaver County

Beaver County's population is forecast to experience an average annual rate of decline of -0.49% over the next 65 years. However, a linear regression trendline based on the county's population patterns over the last 50 years shows some degree of uncertainty. Actual year to year population numbers may swing higher or lower than expected, but the overall trend is likely to remain in the general direction of the overall trendline.

## Beckham County

Beckham County's population is forecast to grow at an average annual rate of 0.38% over the next 65 years. Volatility in the county's population over the last 50 years, historically influenced by developments in the energy sector, reduces the overall fit of this county's linear regression trendline. Up and down swings in population from year to year are expected to continue, much like they have since 1960. However, the long-term growth trend is expected to generally follow the levels indicated by the graph above.

## Blaine County

In 2010, after 12 years of operation, a large private contract correctional facility in Blaine County closed. Those inmates represented approximately one sixth of the county's population before being transferred to other facilities. Efforts to reopen the prison continue but are uncertain at this point. Population forecasts for Blaine County assume the prison remains closed. There is a high level of long term uncertainty associated with projections for Blaine County.

## Bryan County

Bryan County's population is forecast to average a 0.80% annual growth rate over the next 65 years. While Bryan County has shown an unusually high rate of growth over the last five years, expanding by an average annual rate of 2.1%, the long term trend is expected to level off. The linear regression trendline shows a strong degree of fit and should be a good predictor of county growth patterns.

## Caddo County

Caddo County's population growth rate has been relatively flat since 1960, with a 0.07% growth rate and a small degree of volatility in the total population count. A linear regression trendline based on population patterns over the last 50 years indicates that this flat rate of growth will continue between now and 2075, growing at an average annual rate of 0.06%. While the exact population counts from year to year may show variation up and down from these projections, the population as a whole is expected to remain relatively stable.

## Canadian County

Canadian County's population has grown by an annual average 3.8% over the last 5 years, far outpacing growth rates for the state as a whole. Over the next 65 years, Canadian County is forecast to experience an average annual 1.55% growth rate, based on a linear regression trendline of population data since 1960. The level of overall fit is considered strong, but some year to year variation from the forecast is expected.

## Carter County

Over the next 65 years, Carter County's population is forecast to grow at an average annual rate of 0.43%. This is virtually equal to the 0.44% average annual rate experienced since 1960 and only slightly below the 0.54% average annual population growth rate experienced over the last two decades. While population volatility in the 1960s, 1970s and 1980s reduces the overall fit of the linear regression trendline and may indicate some year to year variation for long term forecasts, the variation is expected to balance out over time.

## Cherokee County

Cherokee County is forecast to average 1.27% annual growth between 2010 and 2075, with steady growth being the norm. The linear regression trendline shows an excellent, near exact fit over the last 50 years, and actual population growth patterns are expected to remain very tight around long range forecasts.

## Choctaw County

Choctaw County is forecast to experience a slight average annual population decline of -0.16% between 2010 and 2075. Population volatility in the 1970s reduces the overall fit of the linear regression trendline, but year over year variation in the long term population forecast is expected to be relatively slight.

## Cimarron County

Cimarron County is forecast to experience continued population decline over the next 65 years, though the pace of that decline is expected to gradually slow over time. Between 2010 and 2075, the rate of population decline is expected to average -0.55%. A power regression trendline was used to develop Cimarron County's long term population forecast and the fit appears to be strong. While some year to year variation is expected, swings up and down are expected to be relatively minor.

## Cleveland County

Cleveland County is forecast to have an average annual growth rate of 1.60% over the next 65 years, slightly below the 2.34% population growth rate experienced over the previous two decades. The linear regression trendline shows a strong fit against population growth patterns between 1960 and 2010, and little variation among long range population forecasts is expected.

## Coal County

Coal County's population growth has remained relatively flat over the last 50 years, with only a slight growth pattern expected between now and 2075. From 1960 to 2010, Coal County has shown 0.14% average annual growth, and average annual growth over the next 50 years is expected to remain at 0.10%. While some slight up and down variation may be expected, the overall population trend will most likely remain flat.

## Comanche County

Comanche County is forecast to experience 0.31% population growth between 2010 and 2075. The County has experienced continued up and down swings in population since 1960, but the long term trend has remained generally positive. A linear regression trendline based on population data over the last 50 years shows how wide those swings have been, and similar swings around forecasted population counts are expected to occur between now and 2075.

### ***Decennial Census population counts***

## Cotton County

Cotton County is forecast to have a -.039% average annual population decline over the next 65 years. The linear regression trendline above has a relatively good fit, with greater volatility shown in the 1960s and 1970s. Some year to year variation from population forecasts is expected, but the variation is likely to be relatively small.

## Craig County

Craig County is forecast to have a -0.10% average annual rate of population decline over the next 65 years, based on a linear regression trendline drawn on population data between 1960 and 2010. Population variation around that line is expected to be relatively small between now and 2075.

## Creek County

Creek County's population is forecast to grow at an average annual rate of 0.87%, slightly above the forecast state growth rate. While growth has slowed somewhat over the last 5 years, the linear regression trendline retains a relatively strong fit and is expected to be a good indicator for future growth patterns.

## Custer County

Custer County is forecast to have a 0.39% average annual rate of population growth over the next 65 years. A linear regression formula based on the county's population data from 1960 to 2010 shows a lower degree of fit, but that is largely due to a strong population growth spurt followed by a sharp population decline during the 1980s. Removing that one-time peak would result in a significantly improved overall fit for the regression formula. Some year to year variation from forecasts is expected.

## Delaware County

Delaware County is forecast to experience an annual average growth rate of 1.43% over the next 65 years. The linear regression trendline is an excellent fit with the historic pattern of growth experienced by the county over the last half century, and should be a very good indicator of future growth trends. Little year to year variation is expected.

## Dewey County

Dewey County is forecast to have a continued decline in population, but the pace of that decline is forecast to slow over the next 65 years. On average, the annual rate of decline is forecast to be -0.32%. While Dewey County experienced some population growth in the late 1970s and early 1980s, led by growth in the energy sector, the overall trend has been downward since the 1930s. A power regression trendline based on population data from the last 50 years indicates the population will slowly drop below 4,000.

## Ellis County

Ellis County is forecast to experience continued but slowing population decline over the next 65 years, based on a power regression trendline. The trendline, using data for the last half century, indicates Ellis County's population will decline at an average annual rate of -0.43%, with a somewhat higher rate in the short term and lower rates in the longer term. Some year to year variation from these projections is expected due to the influence of energy developments in the county.

## Garfield County

Garfield County is expected to realize a slight population growth over the next 65 years, growing at an average annual rate of 0.05%. A linear regression trendline based on population history for the last 50 years indicates slow but relatively steady growth, but the quality of the formula's fit shows a high likelihood of year to year variation from the overall trend.

## Garvin County

Garvin County is forecast to have essentially flat long-term population growth over the coming 65 years, with an overall average annual growth rate of 0.00%. However, the degree of fit indicated by a linear regression trendline drawn from population data between 1960 and 2011 indicates that there is a high likelihood of year to year variation from population forecasts.

## Grady County

Grady County is forecast to experience population growth slightly exceeding the state average over the next 65 years. Grady County's population is expected to grow at an average annual rate of 0.88% between now and 2075 with a high level of fit shown by a linear regression trendline. This indicates that there will likely be only small degrees of year to year variation in population forecasts over the long run.

## Grant County

Grant County is forecast to experience a slowing rate of population decline over the coming 65 years, as indicated by a power regression trendline drawn from the county's population history over the last 50 years. The county's average annual population rate of decline is expected to be -0.52%, with a higher rate of decline in the short term and a slower rate of decline experienced in the longer term. The level of fit indicated by the power regression trendline indicates relatively low year to year variation in population forecasts.

## Greer County

Greer County's population history over the last 50 years indicates a slow but consistent rate of population decline, forecast to average -0.42% annually over the next 65 years. A power regression trendline for the county's population since 1960 indicates a high degree of fit, leading to the conclusion that there will be little year to year variation from the overall long term population forecasts.

## Harmon County

Harmon County is forecast to experience a declining average annual population rate of -0.66% between now and 2075. Historic population trends in the county show a slowing rate of population decline and a power regression formula drawn from that data indicates a strong level of fit. Year to year variation from population forecasts is expected to be relatively low.

## Harper County

Harper County is forecast to have a declining rate of population growth over the coming years, with the annual rate of decline averaging -0.52% between now and 2075. The rate of decline is forecast to be somewhat higher in the short term, and lower in the long term. The level of fit for Harper County's power regression trendline is strong, indicating limited year to year variation from population forecasts.

## Haskell County

Haskell County's population forecast anticipates a 0.47% average annual rate of growth between now and 2075. A linear regression trendline drawn on population data over the last 50 years indicates a strong degree of fit, leading to the anticipation of only limited year to year variation from population forecasts.

## Hughes County

Hughes County is forecast to have a -0.16% average annual rate of population decline over the next 65 years. Between 1960 and 2011, the county experienced a -0.16% average annual rate of population decline, with some year to year variations in population data. That same pattern is expected to continue through 2075. While the level of fit for Hughes County's linear regression trendline is somewhat low, the general population trend is expected to follow the forecasted slowly declining pattern.

## Jackson County

Jackson County is forecast to have a declining average annual population rate of -0.38 % for the next 65 years. Since 1960, Jackson County's population has been declining at an average annual rate of -0.22% and a linear regression trendline anticipates the rate of decline will pick up slightly between now and 2075. While the level of fit for this trendline is considered to be fairly strong, some year to year variation with the population projections can be expected.

## Jefferson County

Jefferson County is projected to experience a declining rate of population growth, with a -0.52% average annual rate of decline projected through 2075. Since 1960, Jefferson County experienced an average annual rate of decline of -0.42% and a linear regression trendline on the county's historic population data indicates that the rate of decline will pick up slightly over the next 65 years. The trendline's level of fit, while strong, indicates that there will be some year to year variation in the overall population patterns.

## Johnston County

Johnston County's population forecast shows a 0.50% average annual growth rate over the next 65 years. While below the anticipated 0.74% average annual statewide growth rate, this is relatively close to the county's historic average annual growth rate of 0.57%. A linear regression trendline drawn on population history since 1960 shows a strong level of fit, but some year to year variability is anticipated.

## Kay County

Kay county is forecast to experience an average annual rate of population decline of -0.16% over the next 65 years. This is slightly below the -0.18% average annual rate of decline indicated by county population patterns since 1960. The level of fit for the county's linear regression trendline is relatively strong, but subject to some volatility. However, even after accounting for high growth rates experienced in the 1980s, the long term trend has been for a slow population decline overall. Some year to year variation in the population forecasts can be expected.

## Kingfisher County

Kingfisher County's population growth rate is expected to average 0.32% annually between now and 2075. The county has averaged 0.83% annual population growth since 1960, with very high growth rates in the early 1980s followed by high population declines in the late 1980s. A linear regression trendline drawn from the county's population data over the last half century indicates a somewhat weak level of fit because of that volatility. While the overall trend is for positive growth, year to year variations can be expected.

## Kiowa County

Kiowa County is forecast to experience a slowing rate of population decline over the next 65 years, averaging a -0.39% decline through 2075. The rate of decline is anticipated to be higher in the short term, and slower in the long term. Between 1960 and 2010, the region experienced an annual average decline of -0.73% in population. A power regression trendline indicates a strong fit so while year to year variation from the county's population forecasts can be expected, they are anticipated to be relatively small.

## Latimer County

Latimer County is forecast to experience a 0.52% rate of annual average population growth over the next 65 years. The forecast is based on a linear regression trendline drawn from population patterns over the last 50 years. Recent years have shown some divergence from the trendline's overall pattern, but the overall fit is expected to remain fairly strong. Some year to year variation in population forecasts may become more likely if recent changes are an indication of longer term developments.

## Le Flore County

Le Flore County is forecast to experience a 0.89% average annual growth rate through 2075, slightly above the forecast rate for Oklahoma's overall growth. A linear regression trendline based on the last 50 years of population data shows a strong level of fit, indicating that year to year variation from the long term forecast may be relatively small.

## Lincoln County

Lincoln County is forecast to have an average annual population growth rate of 0.95% over the next 65 years, following the growth pattern indicated by a linear regression trendline of population patterns going back to 1960. This is slightly higher than the expected statewide average annual growth rate of 0.73%. The level of historical fit for the trendline is strong, indicating likelihood that year over year variation from forecast population levels will be relatively small.

## Logan County

Logan County's population is forecast to achieve an average annual population growth rate of 1.02% over the coming 65 years. It should be noted that since 2005 the county has averaged an annual growth rate of 3.64% and that the county may be entering a growth spurt similar to the early 1980s. However, that spurt ultimately returned to the long term growth rate indicated by the linear regression trendline in the above graph. The level of fit is strong, so year to year variation overall is expected to be low.

## Love County

Love County is forecast to experience an average annual growth rate of 0.87% over the next 65 years. This is slightly above the anticipated statewide growth rate of 0.73%. A linear regression trendline based on the county's population patterns going back to 1960 indicates a strong fit overall, with a higher likelihood that forecast populations will be on target over the long term. Some year to year variation in population projections are to be expected, but should be relatively small.

## McClain County

McClain County is forecast to grow at a 1.21% average annual growth rate over the next 65 years, nearly double the growth rate expected for the state as a whole during that time. A linear regression trendline drawn over the growth between 1960 and 2010 indicates a strong level of fit, with little year over year variation from forecasts expected.

## McCurtain County

McCurtain County is forecast to have an average annual growth rate of 0.36% between now and 2075. However, the level of fit indicated by the county's linear regression trendline is weak, heavily influenced by high growth in the early 1970s and not reflecting a gradual rate of decline in effect since the late 1970s. Year over year variation is expected.

## McIntosh County

McIntosh County is forecast to experience a 0.88% average annual population growth rate through 2075. A linear regression trendline based on population patterns over the last half century indicates a strong level of fit, with year to year variation from the long term trend expected to be relatively small.

## Major County

Major County is forecast to experience a slow level of population decline over the coming 65 years, averaging an annual growth rate of -0.14%. High volatility in the county's population, particularly during the 1970s and 1980s, hold strong influence on the linear regression trendline's overall measure of fit. As a result, it is likely that the long term forecasts will experience a high level of year to year differences when measured against final population counts. Over the long term, however, the downward trend is expected to continue.

## Marshall County

Marshall County's average annual growth rate is forecast to be 1.04% over the next 65 years. A linear regression trendline based on the county's growth patterns between 1960 and 2010 indicates a strong level of fit, with little year over year variation expected.

## Mayes County

Mayes County is forecast to experience a long term average annual population growth rate of 1.02%. This is based on a linear regression model drawn using the previous 50 years of population data. The overall trendline fit is strong, with relatively small degree of year to year variation expected from the long term population forecasts.

## Murray County

Murray County is forecast to have a 0.38% average annual population growth through 2075, down slightly from the 0.54% population growth rate over the previous 50 years. Very high population growth rates experienced during the late 1970s and early 1980s help to bring down the overall fit of the linear regression trendline and the county may expect to see year to year up and down swings away from forecast population levels.

## Muskogee County

Muskogee County's population is expected to average a 0.37% annual growth rate over the next 65 years. This is below the expected statewide level of growth, but is a slight increase over the county's 0.29% annual average growth rate experienced between 1960 and 2010. The overall fit indicated by Muskogee County's linear regression trendline is relatively strong, with only a small amount of year to year variation from forecast population levels expected.

## Noble County

Noble County's population is forecast to experience a 0.22% average annual growth rate over the coming 65 years, virtually equal to the 0.23% growth rate experienced over the previous 50 years. The county has shown relatively high up and down population swing between 1960 and 2010 when placed in the context of the county's total population. As a result, the linear regression formula drawn on that history shows a somewhat weak fit. It is likely that volatility in the county's population will continue.

## Nowata County

Nowata County is forecast to experience virtually flat population growth over the next 65 years with an average annual growth rate of 0.00%. Some swing up and down is likely during that span. Over the last 50 years, the county has experienced a very slight average annual rate of decline equaling -0.06%. The level of fit indicated by the linear regression model is very poor when it comes to predicting year to year population values, though the long term trend is expected to be fairly accurate.

## Okfuskee County

Okfuskee County is forecast to experience a 0.06% average annual population growth rate between now and 2075. Since 1960, the county has experienced a very slight average annual growth rate of 0.08%, but the level of fit indicated by the linear regression model is very poor. Year to year population values are likely to move up and down in relation to the trendline and forecasts included in this report.

## Oklahoma County

Oklahoma County is forecast to experience an annual average growth rate of 0.69% over the next 65 years, slower than the growth rate expected by the state as a whole. Between 1960 and 2010, Oklahoma County grew at an average annual rate of 1.27%. In the coming decades, growth is expected to gradually shift to neighboring counties. A linear regression trendline indicates a strong level of fit against historic population trends, and year to year variations against forecast are expected to be relatively low.

## Okmulgee County

Okmulgee County is forecast to see a low annual growth rate, averaging 0.17% between now and 2075. This is equal to the average annual growth rate experienced between 1960 and 2010. Volatility in population levels over the past 50 years mean that the trendline's fit against actual results is strong but not without up and down swings. Year to year variation from long term population forecasts are expected.

## Osage County

Osage County is forecast to have a 0.79% average annual growth rate, slightly higher than the expected state rate between now and 2075. However, this is slightly below the county's 0.93% average annual growth rate experienced between 1960 and 2010. Population volatility in the 1960s and 1970s helped to lower the linear regression trendline's overall fit, but year to year variation against the long term population forecast is not expected to be high.

## Ottawa County

Ottawa County is forecast to have a 0.20% average annual growth rate between now and 2075. This is only slightly below the 0.25% average annual growth rate experienced since 1960. A linear regression trendline based on the last half century of data indicates a fair level of fit, though there have been some population swings up and down during that time. For that reason it is expected that there will be year to year variation from specific population forecasts, but the overall trend will continue on its current path.

## Pawnee County

Pawnee County is forecast to experience a 0.78% average annual rate of population growth between now and 2075. This is virtually equal to the state's 0.73% average annual growth forecast. A linear regression trendline based on the county's growth history since 1960 indicates a good fit, though year to year variation is to be expected.

## Payne County

Payne County is forecast to show a 0.84% average annual population growth rate for the next 65 years, slightly above the average annual growth rate projected for the state as a whole. With a strong fit indicated by the linear regression trendline, the county's population growth pattern is expected to show slight year to year variation over the long term.

## Pittsburg County

Pittsburg County's average annual growth rate is forecast to be 0.43% between now and 2075, a slight reduction in the 0.67% rate experienced between 1960 and 2010. Over the last 50 years, the county has shown steady growth, with a small degree of variation from the overall trend. The county's linear regression trendline shows strong level of fit, so year to year variation is expected to remain relatively slight.

## Pontotoc County

Pontotoc County is expected to have a 0.52% average annual growth rate through 2075. This is slightly below the historic average annual growth rate of 0.67% but mirrors an expected slowdown nationally and statewide. A linear trendline drawn from the last 50 years of population growth shows a strong fit, with year to year variation expected to be relatively low.,

## Pottawatomie County

Pottawatomie County is forecast to see a 0.89% average annual growth rate between now and 2075. The county has experienced continued growth over most of the last 50 years, with the pace of growth being the steadiest over the last 20 years. A linear regression line drawn over this time period shows a strong level of fit so year to year variations are expected to be relatively slight.

## Pushmataha County

Pushmataha County is forecast to experience a 0.47% average annual growth rate between now and 2075, similar to the 0.55% average annual rate experienced over the last 50 years. A linear trendline drawn over the time period indicates a strong level of fit but year to year volatility in these projections can be expected.

## Roger Mills County

Roger Mills County is forecast to experience an average annual decline in population of -0.46% over the next 65 years. The rate of decline is expected to be most pronounced in the short term, with the rate of longer term population decline expected to gradually slow. A power regression trendline based on historic population data indicates a fair degree of fit but some variation from year to year population forecasts can be expected.

## Rogers County

Rogers County is forecast to experience a 1.53% average annual growth rate over the coming 65 years, double the rate of growth forecast for the state as a whole. A linear regression trendline based on historic population data indicates a strong fit and year to year variation in population forecasts are expected to be relatively slight.

## Seminole County

Seminole County is forecast to have a slight population decline over the next 65 years, with an average annual rate of decline of -0.31% between now and 2075. This is slightly higher than the -0.18% average annual rate of decline experienced over the last 50 years, where the decline has consistently been gradual but clear. A linear trendline drawn on the past 50 years of population history indicates a fair degree of fit, with some degree of year to year variation from projections expected.

## Sequoyah County

Sequoyah County is forecast to experience an average annual growth rate of 1.10% over the next 65 years. A review of the past 50 years of population growth for the county yields a linear regression formula with a strong level of fit. Year to year variation from forecasts are expected, but should be relatively slight over the long term.

## Stephens County

Stephens County is forecast to experience a gradual rate of population growth, averaging 0.34% annually. This is nearly identical to the county's historic average annual growth rate of 0.37%. Strong growth in the 1970s and early 1980s, offset by a declining population level in the late 1980s, combine to reduce level of fit for a linear regression formula based on the last 50 years of population trends. Year to year variation from forecasts are likely, but the long term trend of population growth is expected to continue.

## Texas County

Texas County is forecast to experience an average annual population growth rate of 0.54% over the next 65 years. A steep drop in population experienced in the late 1980s was offset by a rapid increase in population over the 1990s. That shift in population reduces the overall fit of the county's linear regression trendline, but outside of that time period, the match remains strong. Some year to year population variation from forecasts may be expected, but the long term growth trend is expected to continue.

## Tillman County

Tillman County is forecast to experience a continued population decline, averaging -0.55% annually between now and 2075. The rate of decline is expected to be most pronounced in the short term, with a gradual slowing in the longer term. Between 1960 and 2010, the county experienced an average annual rate of decline of -0.91%. A power regression trendline based on that time period yields a strong fit, with slight year to year variation from forecasts expected.

## Tulsa County

Tulsa County is forecast to have a 0.84% average annual population growth rate over the next 65 years, slightly above the projected national and statewide growth rates. This is a slowdown compared to Tulsa's average annual growth rate of 1.49% from the prior 50 years, but reflects a similar growth slowdown expected to occur statewide and nationally. A linear regression trendline drawn over the county's population history since 1960 shows strong fit.

## Wagoner County

Wagoner County is forecast to experience 1.51% average annual growth between now and 2075. This is double the statewide growth rate forecast for the same period. A linear regression trendline drawn from historic population data since 1960 indicates a strong level of fit, with slight year to year variation expected from the overall trend.

## Washington County

Washington County is forecast to have an average annual growth rate of 0.37% over the next 65 years. The county experienced strong population growth in the 1970 and early 1980s, but that growth was partially offset by population declines over the mid to late 1980s. These events combine to reduce the overall fit for the county's linear regression trendline. While some year to year variation in population forecasts can be expected, the long term positive growth trend is expected to continue.

## Washita County

Washita County is forecast to experience a -0.31% average annual rate of population decline over the next 65 years. However, the possibility of strong year to year variation is expected based on the strong population swings experienced in the 1960s, 1970s and 1980s. A power regression trendline based on historic population counts over the last half century shows a weak fit. Because the county's population appears to have stabilized over the last two decades, it is possible that the declining trendline

## Woods County

Woods County is forecast to experience a -0.39% average annual rate of population decline between now and 2075, a slowing of the -0.51% average annual rate of decline experienced since 1960. A linear regression trendline drawn over the last 50 years of population data indicates a strong level of fit, with year over year variations from forecasts expected to be small.

## Woodward County

Woodward County is forecast to have a 0.45% average annual rate of population growth between now and 2075. The county has experienced significant population variation during the last 50 years, with a peak experienced in the early 1980s, followed by a sharp population decline. The resulting spike reduces the overall fit of a linear regression trendline, indicating that some year to year population variation from forecasts can be expected.
