Abstract

The presentation goes into a summary of what PFLOTRAN does, which is to model subsurface flow and transport, and why PyFLOTRAN is created. The bulk of the slides present how the PyFLOTRAN graphical user interface is structured, and the functionalities of the application. The presentation shows screenshots of the application, and a bit of the many individual components that are strapped with the main window. Lastly, future work is described where reading from input files, and migrating to a web app is suggested.

PyFLOTRAN

Graphical User Interface

PFLOTRAN

• PFLOTRAN is a massively parallel subsurface flow and reactive transport code Developed in the DOE complex for the purpose of understanding problems related to: -Energy, climate and national security. Some of the present applications of PFLOTRAN include geothermal energy extraction, carbon sequestration, nuclear waste repository science, Arctic hydrology and groundwater flow.

Dissolved CO2 mole fraction corresponding to an elapsed time of 300 years
